

INFORMATION. PROJECT PLANNING. MAINTENANCE.

# MANAGE YOUR ASSETS.

GeoNAM is a web-based solution for planning, implementing, and documenting business processes.

GeoNAM helps ensure safe operation and excellent availability throughout the asset life-cycle.

## An open system for distributed data

GeoNAM is designed to use data from a variety of sources and to combine it into a unified, clear and user-friendly set of views. Data from other systems is pulled in via configurable interfaces, e.g., asset information and geospatial data from GIS or ERP software. External geographical data by Microsoft Bing, or OpenStreetMap can be used with standard protocols such as WMS or WFS. Documents and pictures can be archived in a document management system and accessed from GeoNAM. A sophisticated permissions management allows users to access just the set of data they need for their work.

## BENEFITS AT A GLANCE

1. Native web application with asset information terminal
2. Flexible configuration of specific business processes
3. Integration of GIS and ERP data
4. Display of map data and alphanumerical information for networks, assets and plans
5. Freely configurable asset hierarchy
6. Document management and document-asset relationships
7. Flexible permissions management
8. Integration for mobile devices
9. Software as a service or integrated into enterprise IT

## User Rights Administration

Rights management organizes the visibility of data for different internal and external user groups depending on their area of responsibility. This lays the foundation for simplified communications throughout the organization.

## Dashboards and Reports

Keep your team and stakeholders up to speed on project progress through dashboarding and reporting. Understand what stage you are at with a project, who has done what to get there, and what is left to complete the job.

## Planning and Maintenance

GeoNAM provides planning functionality and comprehensive documentation for all maintenance tasks. You can create schedules and inspection plans to ensure and document up-to-date regulatory compliance. Customer-specific job completion forms make it easy to meet your company's internal standards.

## Business Processes

Business processes need to be adapted to changing requirements and are subject to continual improvement. The GeoNAM workflow engine provides functionality for flexible process modelling. You can create graphical process models and run them in GeoNAM to create the related user tasks and documents. GeoNAM also integrates with mobile devices to let users complete their assigned process steps directly in the field. Your staff can use their smartphones or tablets, and their data will automatically be synchronized with the central GeoNAM application as soon as the signal strength is adequate.
